

Social Welfare and Stable Matching

Industrial Engineering and Operations Research

October 9, 2023

Outline

1 Utility Functions and Average Ranks

- TTC Algorithm
- GS Algorithm

2 Pareto Optimality and The GS Algorithm

- 100 Simulations
- 10 Simulations
- 1 Simulation
- 90 student 100 schools

Sensible Utility Functions

(a) $u(M) = (\prod_{i \in S} u(i, \mu(i)))^{\frac{1}{n}}$
 $u(i, \mu(i)) = n + 2 - \text{rank}_i$

(b) $u(M) = \min(u(i, \mu(i)))$
 $u(i, \mu(i)) = 1/\text{rank}_i$

$$(a) \quad u(M) = \sum_{i \in \text{ranks}} x_i^{(n+1-\text{rank}_i)/n+1} - x_{n+1}$$

$$(b) \quad u(M) = \sum_{i \in \text{ranks}} x_i^2 - x_{n+1}$$

$$(a) \prod_{i \in \text{ranks}} \frac{x_i^{(n+1-\text{rank}_i)/n+1}}{x_{i+1}^{(n+1-\text{rank}_{i+1})/n+1}}$$

$$(b) \prod_{i \in S} \frac{1}{4} - \frac{1}{2(n+1-\text{rank}_i)^2}$$

$$(a) \sum_{i \in students} 1 - e^{-(n+1-rank_i-(n+1)/2)}$$

$$(b) \sum_{i \in students_{>.5}} 1 - e^{-(n+1-rank_i-(n+1)/2)} - \sum_{i \in students_{<.5}} 2 * e^{(n+1-rank_i-(n+1)/2)}$$

Average Rank of Match

For a Match μ between students \mathcal{S} and schools \mathcal{H} , the average rank (corresponding to original full list) for students is:

$$R(\mu) = \frac{1}{n} \left(|\bar{\mathcal{S}}(\mu)|(|\mathcal{H}|+1) + \sum_{s \in \mathcal{S} \setminus \bar{\mathcal{S}}(\mu)} \text{Rank}_s(\mu(s)) \right)$$

where $\bar{\mathcal{S}}(\mu)$ are the unmatched students. Average Rank for schools are computed with the equivalent function.

Figure: Average rank of match for the market

Outline

1 Utility Functions and Average Ranks

- TTC Algorithm
- GS Algorithm

2 Pareto Optimality and The GS Algorithm

- 100 Simulations
- 10 Simulations
- 1 Simulation
- 90 student 100 schools

The GS output and Pareto Optimality

(a) Proportion of experiments with a Pareto Optimal matching

(b) Proportion of students that weren't Pareto Optimal

Welfare in GS Output vs Pareto Optimality

(a) Nash Welfare

$$u(M) = \left(\prod_{i \in S} u(i, \mu(i)) \right)^{\frac{1}{n}}$$

$$u(i, \mu(i)) = n + 2 - \text{rank}_i$$

(b) Leontief Utilities

$$u(M) = \min(u(i, \mu(i)))$$

$$u(i, \mu(i)) = 1/\text{rank}_i$$
